

# Shore Structures

## Protect Upland Resources

### Properly designed and built shore structures help protect important upland resources.

Both hard and soft structures help protect the upland resources at Cedar Point Amusement Park from the forces of wind and wave energy.

The hard structures include a jetty, breakwaters, bulkheads, revetments and seawalls, the latter of which forms a boardwalk in front of the hotels. The seawall is placed at the back (landward) side of the beach.

The beach, dunes and dune vegetation are soft structures that also provide erosion protection.

Upland resources protected by shore structures include, hotels, restaurants, parking lots, marina facilities, roller coasters and other attractions.
